

hflip will be able to define two URLs - one for an rtl image and one for ltr image.	
Yuval Atzmon	In favor, user's responsibility to make sure the same height/width settings work for both images
Simon Montagu	In favor (I'll work out a suggestion for the syntax and send it to the list)
Tom Bigelajzen	Against. Not enough of an improvement to justify still more new syntax.
Shoshannah Forbes	In favor, user's responsibility to make sure the same height/width settings work for both images
Amit Aronovitch	-
make sure that hflip doesn't cause a bug in vector graphics

 - change default alignment -- the default alignment for should not be according to its dir but according to the list's dir (rtl list item in an ltr list should be aligned to the left unless explicitly stated otherwise)

When using dir="auto" the implementation must determine the direction before it displays any part of the text.

The bdi values could be: before after both none , instead of the suggested yes, no, and bdi.	
Yuval Atzmon	Against, I prefer the simpler yes/no (although I admit I'm not sure what before/after means for isolatoin)
Simon Montagu	Against (I'm not sure what the use case is, and it is likely to complicate the implementation)
Tom Bigelajzen	Against. Too complicated, no clear use case, and may make it more difficult to integrate into CSS.

Amit Aronovitch	
The behavior of a scroll bar in frame should be determined. Probably should be according to the body of the inner document.

The workaround suggested for title on an outer element doesn't work on an alt. on the other hand, you don't really need that workaround since you can put the alt direction in the dir attribute, which has on other use on an image. we agree that it would be clearest to have altdir and titledir.
