

Fujitsu's scenarios for demonstration and plugfest of Web of Things

May. 15th, 2017

Fujitsu Laboratories Ltd.

Overview of our demonstration

- Application operates Device shadows on cloud using WoT API.
- Synchronization mechanism can help to control widely distributed legacy devices via gateways.

When this room become dark, LED lighting is turned on.

Synchronize

Fujitsu Nagoya

Application

Node-RED

↕ **WoT API with HTTP**

WoT servient on cloud

Device shadows corresponding to devices on gateways

WoT API

WoT servient on gateway

BLE

Brightness Sensor

EtherCAT

Rotating Lamp

Panasonic Osaka

WoT API

WoT servient on gateway

ECHONET Lite

LED lighting

Blind

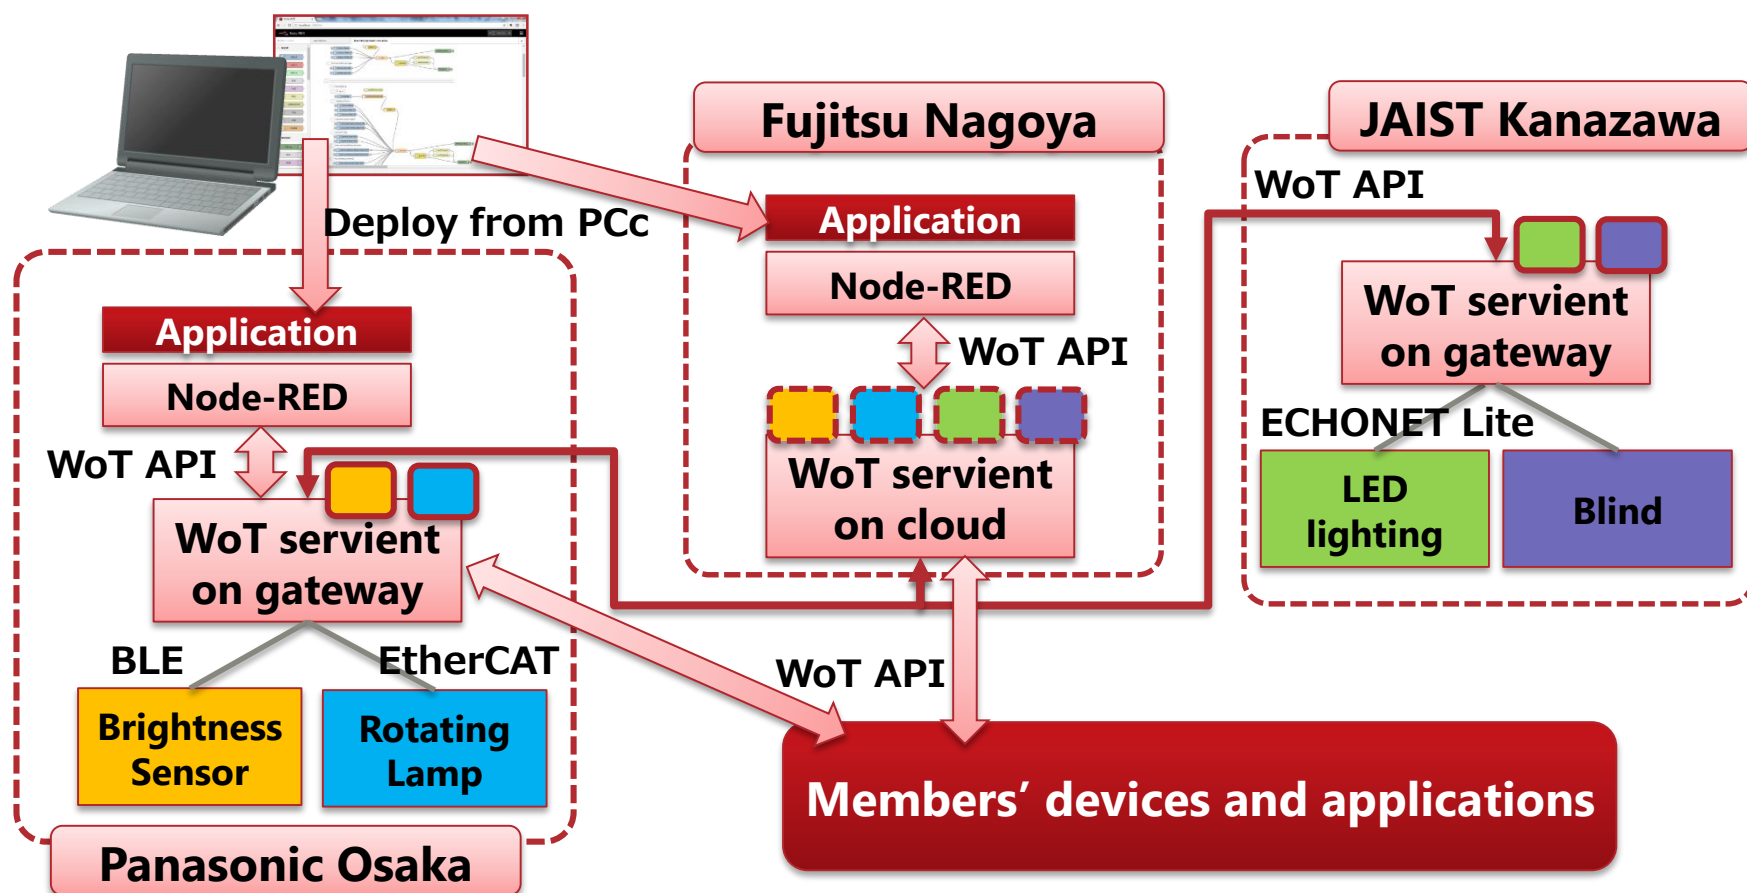

iHouse – smart home

JAIST Kanazawa

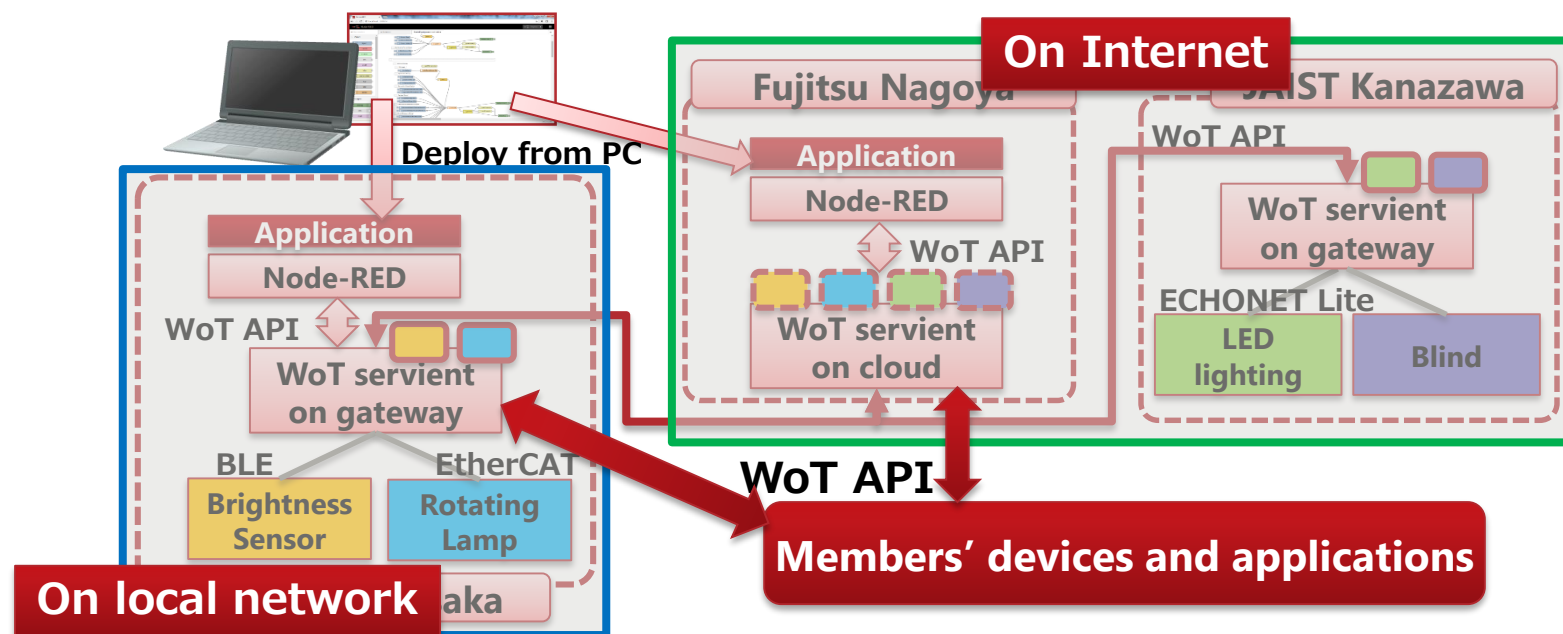

System diagram

- Applications are executed on Node-RED connecting to WoT servient with WoT API. Node-RED runs on both of gateway and cloud.
- Application will be deployed from PC browser to both.
- Members' device and application can be connected with WoT API

How to connect to our system

- Your devices and application can be connect to our system via WoT Servients on Cloud on the Internet or Gateway on the local network.
- If yours are on the Internet, connect to the Servient on cloud. If on the local network, connect to the gateway.
- TD will be registered manually in our system. If your devices will connect, send us your TDs. If your application will connect to our devices, we'll send you our TDs after IP addresses are assigned.
- Rest of slides show our TDs for your reference.

TD (LED lighting on smart home)
