

Data Model to aid Endpoint Reference Discussions

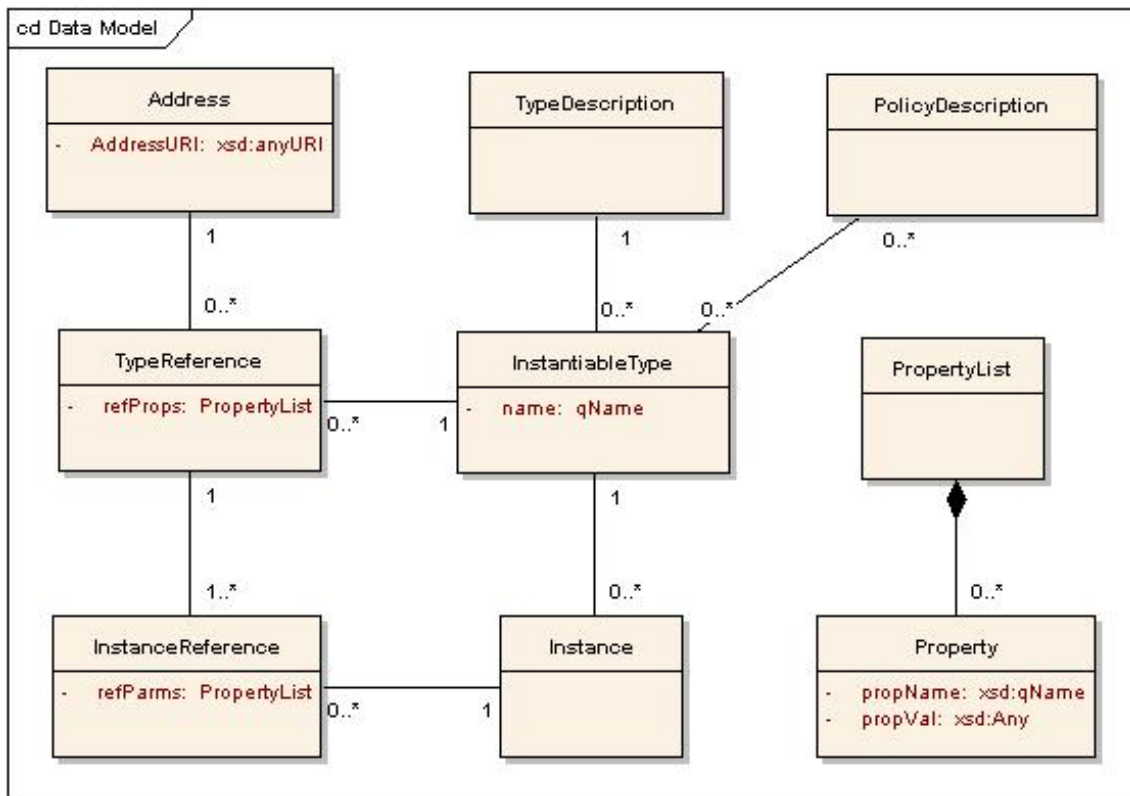

Figure 1 - Endpoint Reference Data Model

Figure 1 is a simplified data model for endpoint references.

A particular service Instance, which is of a particular InstantiableType (comprising a wsdl Description and a set of policy descriptions), can have zero or more EndpointReferences.

Each EndpointReference is composed of:

- a single Address portion (with AddressURI value);
- a single TypeReference portion (with referenceProperties): and
- a single InstanceReference. Portion (with referenceParameters).

Each Address can have zero or more TypeReferences associated with it.

Each TypeReference can have one or more Instance References associated with it.
