IDL attributes

- ✍ **Use of attribute is syntactic sugar for defining a get and set operation**
- ✍ **The concrete programming language syntax for the getter/setter is defined by the IDL language binding which defines the:**
 - **operation name**
 - **parameter types**
 - **return type, if any**
- ✍ **A readonly attribute does not have a set operation**

Example

// IDL example

```
interface foo {  
    attribute long myattr;  
};
```

// Java

```
public interface foo extends  
    org.omg.CORBA.portable.IDLEntity {  
    int myattr;  
    void myattr(int p1);  
}
```
