# 1 2.4 Document Subsets

- 2 Some applications require the ability to create a physical
- 3 representation for an XML document subset (other than the
- 4 one generated by default, which can be a proper subset of
- 5 the document if the comments are omitted). Implementations
- 6 of XML canonicalization that are based on XPath can
- 7 provide this functionality with little additional overhead by
- 8 accepting a node-set as input rather than an octet stream.
- 9 The processing of an element node *E* MUST be modified
- 10 slightly when an XPath node-set is given as input and the
- 11 element's parent is omitted from the node-set. This is
- necessary because omitted nodes SHALL not break the
- 13 inheritance rules of inheritable attributes [C14N-Issues]
- 14 defined in the xml namespace.
- 15 [Definition:] **Simple inheritable attributes** are attributes
- 16 that have a value that requires at most a simple
- 17 redeclaration. This redeclaration is done by supplying a new
- value in the child axis. The redeclaration of a simple
- <sup>19</sup> inheritable attribute *A* contained in one of *E*'s ancestors is
- 20 done by supplying a value to an attribute Ae inside E with the
- same name. Simple inheritable attributes are xml:lang and
- 22 xml:space.
- The method for processing the attribute axis of an element E
- in the node-set is hence enhanced. All element nodes along
- *E*'s ancestor axis are examined for the nearest occurrences
- <sup>26</sup> of simple inheritable attributes in the xml namespace, such
- 27 as xml:lang and xml:space (whether or not they are in the
- node-set). From this list of attributes, any simple inheritable
- attributes that are already in *E*'s attribute axis (whether or not
- 30 they are in the node-set) are removed. Then,

Frederick Hirsch 11/5/07 2:52 PM Deleted: some of the Frederick Hirsch 11/5/07 2:53 PM Deleted: ancestors are

- 31 lexicographically merge this attribute list with the nodes of
- 32 *E*'s attribute axis that are in the node-set. The result of
- visiting the attribute axis is computed by processing the
- 34 attribute nodes in this merged attribute list.

35 36	The $xml:id$ attribute is not a simple inheritable attribute and no processing of these attributes is performed.
37	The xml:base attribute is not a simple inheritable attribute
38	and requires special processing beyond a simple
39	redeclaration. Hence the processing of <i>E</i> 's attribute axis
40	needs to be enhanced further. A "join-URI-References"
41	function is used for xm1:base fix up. It incorporates xml:base
42	attribute values from omitted xml:base attributes and
43	updates the xml:base attribute value of the element being
43 44	fixed up, as follows.
45	An xml:base fixup is performed on an element E as follows.
46	Let <i>E</i> be an element in the node set whose ancestor axis
47	contains successive elements <i>EnE1</i> (in reverse document
48	order) that are omitted and $E=En+1$ is included. (It is
49	important to note that EnE1 is for contiguously omitted
50	elements, for example only e2 in the example in section 3.8.)
51	The fix-up is only performed if at least one of E1 En had
52	an xml:base attribute. In that case let X1 Xm be the values
53	of the xml:base attributes on $E1 \dots En+1$ (in document order,
54	from outermost to innermost, $m \le n+1$ ). The sequence of
55	values is reduced in reverse document order to a single
56	value by first combining Xm with Xm-1, then the result with
57	<i>Xm-2</i> , and so on by calling the "join-URI-References"
58	function until the new value for <i>E</i> 's xml:base attribute
59	remains. The result may also be null or empty (xml:base="")
60	in which case xml:base MUST NOT be rendered.

Frederick Hirsch 11/5/07 5:36 PM Deleted: ,

Frederick Hirsch 11/5/07 5:36 PM Deleted: which

Frederick Hirsch 11/5/07 5:42 PM Deleted: takes any URI (Base) from an ancestor and joins a relative URI of *E* (R) (in most cases after the last slash) of the former and then normalizes the result. We describe here a simple method for providing this functionality similar to that found in sections 5.2.1, 5.2.2. and 5.2.4. of RFC 3986 with the following modifications: <#>Perform RFC 3986 section 5.2.1. " Pre-parse the Base URI" modified as follows. .

<#>The scheme component is not required in the base URI (Base). (i.e. Base.scheme may be null)

<#>Perform <u>RFC 3986</u> section 5.2.2. "Transform References" modified as follows to ignore the fragment part of R <#>After parsing R set R.fragment = null <#>5.2.4. "Remove Dot Segments" is modified to keep leading "./" segments and to prevent the erroneous creation of an output that looks like a net path. (seg/.././/pseudo-netpath/seg/file.ext) <#>several changes as in "Remove Dot Segments" ... (see Apendix) -

Frederick Hirsch 11/5/07 5:43 PM Formatted: Font:Courier, 12 pt

Deleted: This function may also be called with the URI to be fixed up (R) being null (i.e. when no xml : base attribute exists in E) or empty "" (xml : base=""). The base URI (Base) may also be unknown in which case the Algorithm is performed with Base.scheme = null, Base.authority = null, Base.path = "" and Base.query = nu [... [1])
