● Future plans
Overview

• Purpose:
  ○ to enable Tizen IVI developers with rich access to vehicle information
Use cases

1. Developer wants to write a tachometer application in html5
2. Developer wants to write an application that controls the HVAC system
3. Developer wants to retrieve the vehicle average economy analytics from last week
1. Developer wants to write a tachometer application in html5

- get ()

```javascript
interface Vehicle {
  /**
   * @brief returns supported properties
   * @arg VehiclePropertyCallback successCallback function to be called when method has completed successfully
   * @arg VehiclePropertyErrorCallback errorCallback this function is called when an error has occurred.
   */
  getSupported(SupportedPropertiesCallback successCallback, optional VehiclePropertyErrorCallback errorCallback);

  /**
   * @brief fetch the current value for 'property'.
   * @arg DOMString property is the requested property to be retrieved.
   * @arg VehiclePropertyCallback successCallback function to be called when method has completed successfully
   * @arg VehiclePropertyErrorCallback errorCallback this function is called when an error has occurred.
   */
  get(DOMString property, VehiclePropertyCallback successCallback, optional VehiclePropertyErrorCallback errorCallback);
};

interface VehicleSpeed : VehiclePropertyType {
  /**
   * VehicleSpeed
   * @brief Must return Vehicle Speed in kilometers per hour.
   */
  readonly attribute unsigned long VehicleSpeed;
};
```
Example

1. Developer wants to write a tachometer application in html5

```javascript
navigator.vehicle.get("VehicleSpeed", onsuccess, onerror);

function onsuccess(value) {
  window.console.log(value.VehicleSpeed);
}

function onerror(e) {
  window.console.error(e.message);
}
```
2. Developer wants to write an application that controls the HVAC system
   - set ()

```c
/**
 * \brief set the given property to value
 * \arg DOMString property property to set
 * \arg VehiclePropertyType value value to set
 * \arg VehiclePropertyCallback successCallback callback if operation is successful
 * \arg VehiclePropertyErrorCallback errorCallback callback if error has been called.
 **/
set(DOMString property, VehiclePropertyType value, optional VehiclePropertyCallback successCallback, optional VehiclePropertyErrorCallback errorCallback);
```
Example

2. Developer wants to write an application that controls the HVAC system

```javascript
navigation.vehicle.set("HVAC",
    {
        'AirflowDirection':
            AirflowDirection.AIRFLOWDIRECTION_FRONT
    },
    onSuccess, onError);
```
3. Mechanic wants to retrieve the vehicle information from last week.
- getHistory ()

```javascript
/**
 * @brief get values for a given property within a certain past time period between 'startTime' and 'endTime'
 * @arg DOMString property property to request
 * @arg Date startTime, starting period of time.
 * @arg Date endTime, ending period of time.
 * @arg VehiclePropertyListCallback successCallback. Callback with the result of the method call
 * @arg VehiclePropertyErrorCallback errorCallback. Callback if an error has occurred.
 */
getHistory(DOMString property, Date startTime, Date endTime, VehiclePropertyListCallback successCallback, optional VehiclePropertyErrorCallback errorCallback);
```
Example

3. Mechanic wants to retrieve the vehicle information from last week.

```javascript
var startDate = new Date("April 5, 2013 11:13:00");
var endDate = new Date("April 10, 2013 11:13:00");

navigator.vehicle.getHistory("VehicleSpeed", startDate, endDate, onsuccess)

function onsuccess(values) {
  window.console.log(values.count());
}
```
Data Types

```c
interface Acceleration : VehiclePropertyType {
    /** X */
    * \brief Must return acceleration on the "X" axis as 1/1000 G (gravitational force)
    **/
    readonly attribute unsigned long X;

    /** Y */
    * \brief Must return acceleration on the "Y" axis as 1/1000 G (gravitational force)
    **/
    readonly attribute unsigned long Y;

    /** Z */
    * \brief Must return acceleration on the "Z" axis as 1/1000 G (gravitational force)
    **/
    readonly attribute unsigned long Z;
};
```
Events

```javascript
navigator.vehicle.addEventListener("VehicleSpeed", vehicleSpeedHandler, null);

function vehicleSpeedHandler(data) {
  window.console.log(data.VehicleSpeed + " kph")
}
```
Future

- Transfer from WAC-style callbacks to W3C style
  - Use DOMFuture

```javascript
interface Vehicle {
  ...
  DOMFuture speed; // async
};

navigator.vehicle.speed.then(onsuccess, onerror);

function onsuccess(value) {
  window.console.log(value.VehicleSpeed);
}

function onerror(e) {
  window.console.error(e.message);
}
```

Tizen Vehicle API draft specification:

http://otcshare.github.io/automotive-message-broker/docs/vehicle_spec.html

Draft WebIDL:

https://raw.github.com/otcshare/automotive-message-broker/master/docs/amb.idl

Contact:

Kevron Rees: kevron.m.rees@intel.com
Where do we start?

1. Use all data from all specs (worry about OBD-II later)
2. Normalize the data, agree on units, etc
3. ...
4. Profit
