# OMG Production Rule Representation

PRR Team Presentation

W3C RIF F2F3, June 2006

## Intro: **OMG PRR**

- ▶ Rule standard based on OMG model
  - ▶ Mainstream IT focus (looking at near-term)
  - ▶ Based on UML mantra
    - ▶ Software models
    - ▶ Metamodels (including MOF – metamodel standardisation)
  - ▶ Large vendor community + specialist organisations
    - ▶ Platform, domain focuses
    - ▶ Mostly traditional IT types
      - ▶ Rules are not considered platform, but business domain
      - ▶ Other OMG stds eg QVT  
define declarative rules but in a custom format
  - ▶ Standards based on existing implementations (+ inventions)

## Intro: PR rule engines

- ▶ Approach for implementing flexible business rules in IT systems:
  - ▶ **Production rules** executed by a **rule engine**
    - ▶ Declarative “If.. Then..” rules
    - ▶ Rules defined in sets (rulesets)
    - ▶ High performance algorithms (eg Rete)
    - ▶ Common execution API (see Java JSR-94)
  - ▶ Rules represent behaviour = actions (data updates, invokes...)
  - ▶ Powerful deductions / inferences can be made
  - ▶ Rules can be changed independent of program logic
  - ▶ Users include government, insurance, retail, engineering...

## Problem: What is the standard for rule engines?

- ▶ Today: non-standard approaches used to represent production rules:
  - ▶ Vendors' own representations + associated XML schema
    - ▶ Fair Isaac Blaze Advisor (SRL), Ilog JRules (IRL)  
LibRT (RBML), JESS, DROOLS, etc
  - ▶ Vendor-specific standards
    - ▶ IBM BRML, Ilog SRML, Haley HRML etc
  - ▶ Domain-specific standards
    - ▶ ACORD SPX insurance validation rules, XBRL business report rules, etc

This is a problem! Difficult to interchange, little understanding, fear of lock-in...

# Solution: Production Rule Representation

- ▶ 1<sup>st</sup> general standards body to address rule standards –  
OMG – via its Business Rules Working Group
- ▶ Production Rule Representation proposed as a cross-  
vendor (of rule engines) rule modeling representation
- ▶ Consortium of developers and supporters  
from the  
rule vendor community (Fair Isaac, Ilog, etc)  
+ academic community (RuleML.org)  
+ related vendor community (BPM, UML)

Ruleml.org

## What is PRR?

1. Formal model for production rules
  - ▶ Uses OMG MOF, defined in UML
  - ▶ Extends UML
  - ▶ Provides an XML format (XMI)
2. Vendor-neutral UML-friendly rule representation
  - ▶ Intended to be defined via tools, not business users!

OMG PRR is expected to be submitted to OMG later in 2006 as part of the OMG standards process

# PRR 1.0 Goals

- ▶ Metamodel for production rules:
  - ▶ 2 rule “semantics” considered:
    - ▶ Forward chaining inference rules (e.g. Rete-model)
      - ▶ For commonly-used PR rule engines
    - ▶ Sequentially processed procedural rules (e.g. scripts)
      - ▶ For tools that separate out simple business logic as non-inference production rules
- ▶ Interchange for rule modeling via XMI
  - ▶ Import / export rules between UML tools and BRMSs
- ▶ UML: production rules to be considered as 1<sup>st</sup> class citizens alongside objects

## PRR 1.0 – Vendor Applicability

### ▶ Today:

- ▶ Executable Rule Engine vendors e.g.
  - ▶ Fair Isaac Blaze Advisor
  - ▶ ILOG JRules
  - ▶ IBM Websphere
  - ▶ ...
- ▶ UML tool vendors
  - ▶ IBM Rational
  - ▶ ...

### ▶ Future:

- ▶ Software technologies that need to co-exist with executable rules
  - ▶ BPM / workflow
  - ▶ EAI / middleware
  - ▶ MDA / CASE
  - ▶ SBVR-type documented business rules

# PRR 1.0 - out of scope

## 1. Rule Management

- ▶ Business syntax for production rules
- ▶ Metadata, templates etc

## 2. Rule / Decision metaphors

- ▶ Explicit decision tables and trees
- ▶ Other decision visualizations that can map to production rules

## 3. Other rule types

- ▶ ECA rules
- ▶ Formal logic
- ▶ Constraint-based reasoning
- ▶ Data relationship (ER model) rules / ontological rules

## 4. Other production rule semantics

- ▶ Backward chaining inference rules
- ▶ Ruleflows (e.g. activity diagrams for ruleset orchestration)

## PRR 1.0 – scope creep

- ▶ To implement a PR metamodel, need to define a generic rule metamodel for future extensions to other rule types
- ▶ Therefore PRR \*includes\* a generic rule metamodel (as no such thing exists in OMG / UML today)
- ▶ PRR must also be compatible with non-UML representations
  - ▶ Expression (condition + action) language used outside of UML
  - ▶ Object models mapped from UML class diagrams
- ▶ PRR therefore defined at 2 levels
  - ▶ PRR core: general Rule + PR model
  - ▶ PRR OCL: PRR core + extended OCL expression language

# 5-minute Guide to OMG: MDA

## Model Driven Architecture (MDA)

Computation  
Independent  
Models (CIM)

Business  
Models

Rarely considered  
by the UML  
community

# MDA is the logical successor to CASE

## Model Driven Architecture (MDA)

Computation  
Independent  
Models (CIM)

Business  
Models

Technically: these models in MDA are also “UML” – they are described using UML

Platform  
Independent  
Models (PIM)

UML  
Models

Classic models: class diagrams, activity diagrams, etc

Can include detail like action language for behavior, OCL for constraints...

# “Picture to code” in as few steps as possible

## Model Driven Architecture (MDA)

Computation  
Independent  
Models (CIM)

Business  
Models

Platform  
Independent  
Models (PIM)

UML  
Models

Platform  
Specific  
Models (PSM)

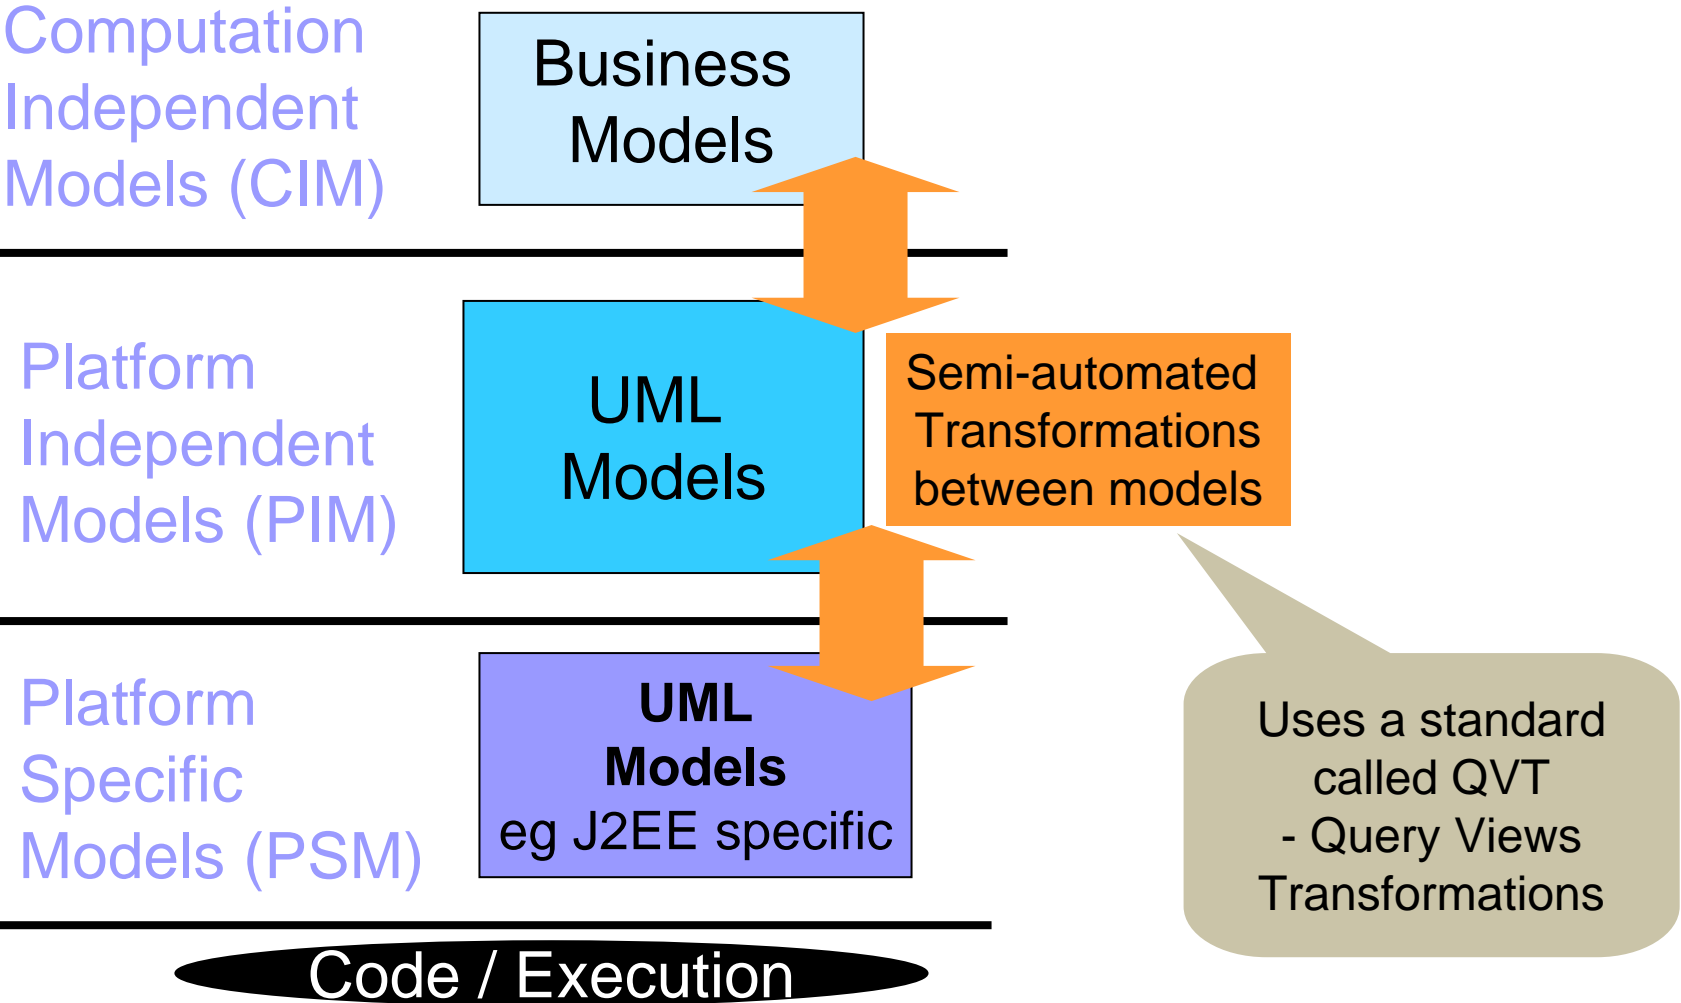

UML  
Models  
eg J2EE specific

Code / Execution

Includes xUML  
“engines” as well as  
Java etc

# Leading to things like “Executable UML” 😊

## Model Driven Architecture (MDA)

# Supported by UML and XMI

## Model Driven Architecture (MDA)

Computation Independent Models (CIM)

Business Models

Platform Independent Models (PIM)

XML schema for representing model entities (and metamodel entities etc)

XML Models

Semi-automated transformations between models

XML Metadata Interchange (XMI)

Platform Specific Models (PSM)

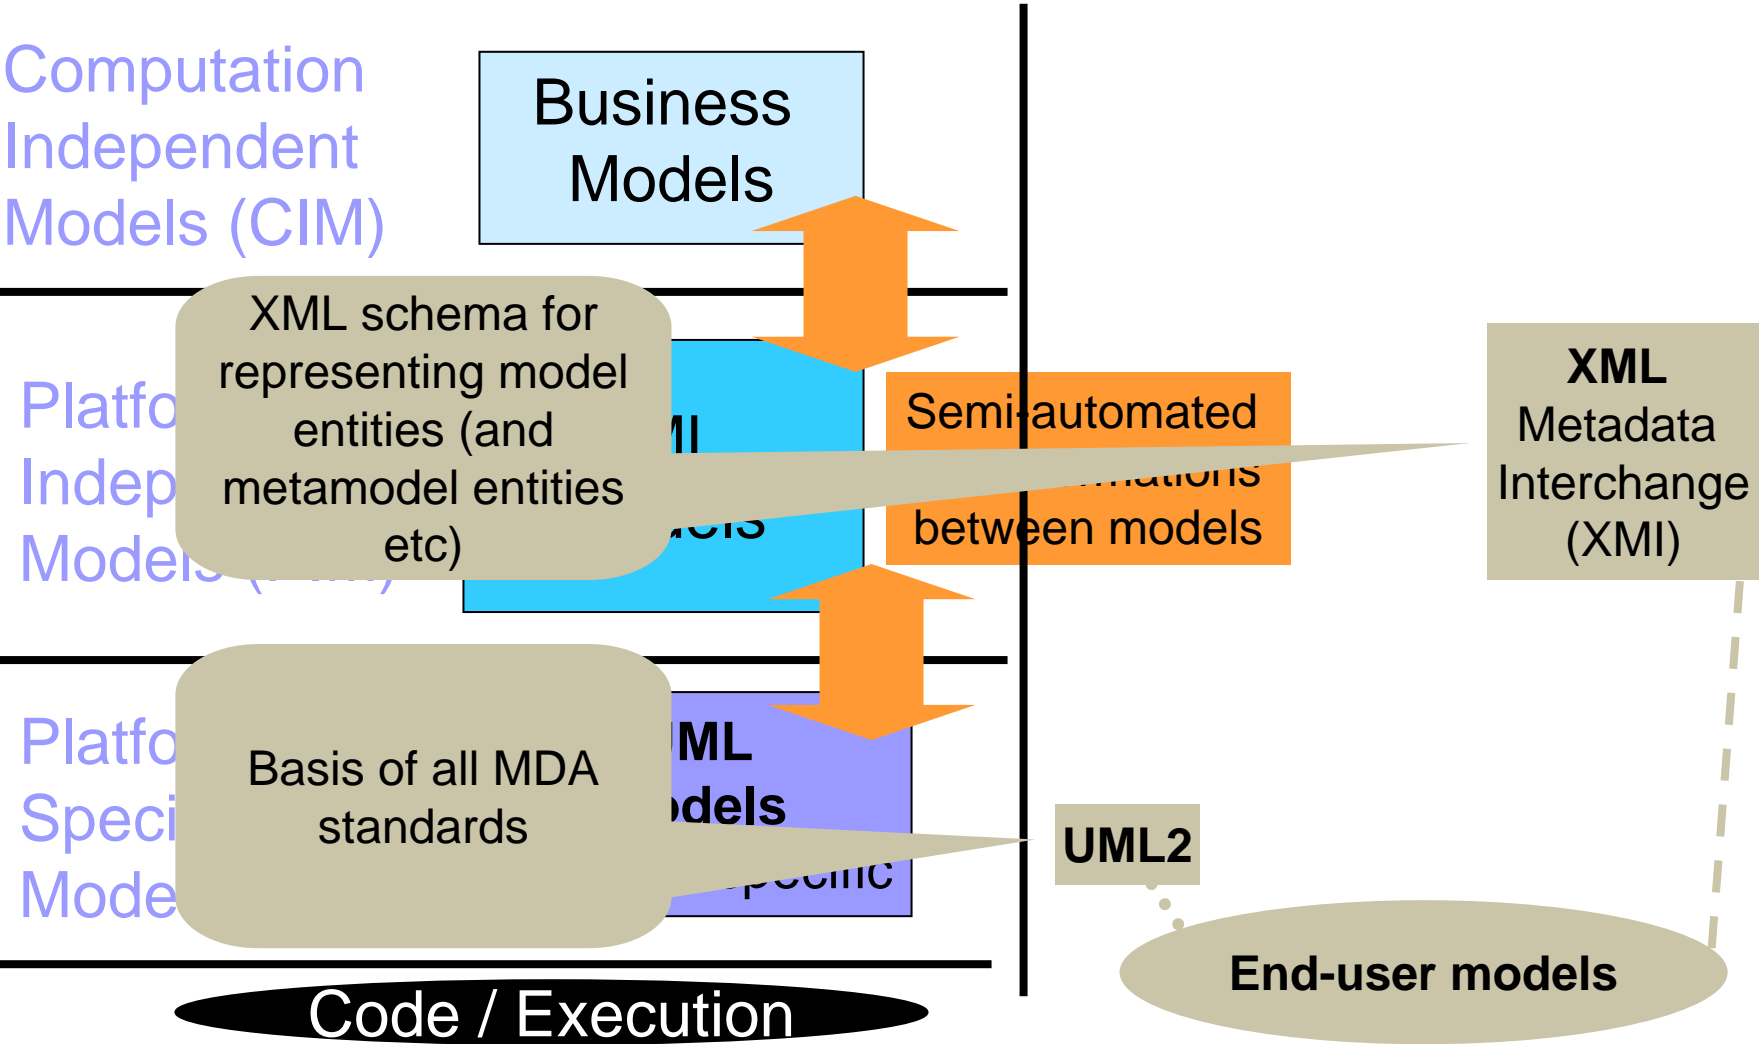

Basis of all MDA standards

XML Models

UML2

End-user models

Code / Execution

# OMG main activity= defining metamodels

## Model Driven Architecture (MDA)

Computation Independent Models (CIM)

Business Models

Platform Independent Models (PIM)

Metamodels are represented as models themselves

XML

Semi-automated Transformations between models

XML Metadata Interchange (XMI)

Platform Specific Models (PSM)

UML Models  
eg J2EE specific

Metamodel  
eg domain classes

UML2

Customer models

Code / Execution

# Metamodels too! All defined in UML

## Model Driven Architecture (MDA)

Computation Independent Models (CIM)

Business Models

**MetaMetamodel**  
MetaObject Facility (MOF)

Platform Independent Models (PIM)

UML Models  
MOF = repository standard

Semi-automated Transformations between models

**XML**  
Metadata Interchange (XMI)

Platform Specific Models (PSM)

**UML Models**  
eg J2EE specific

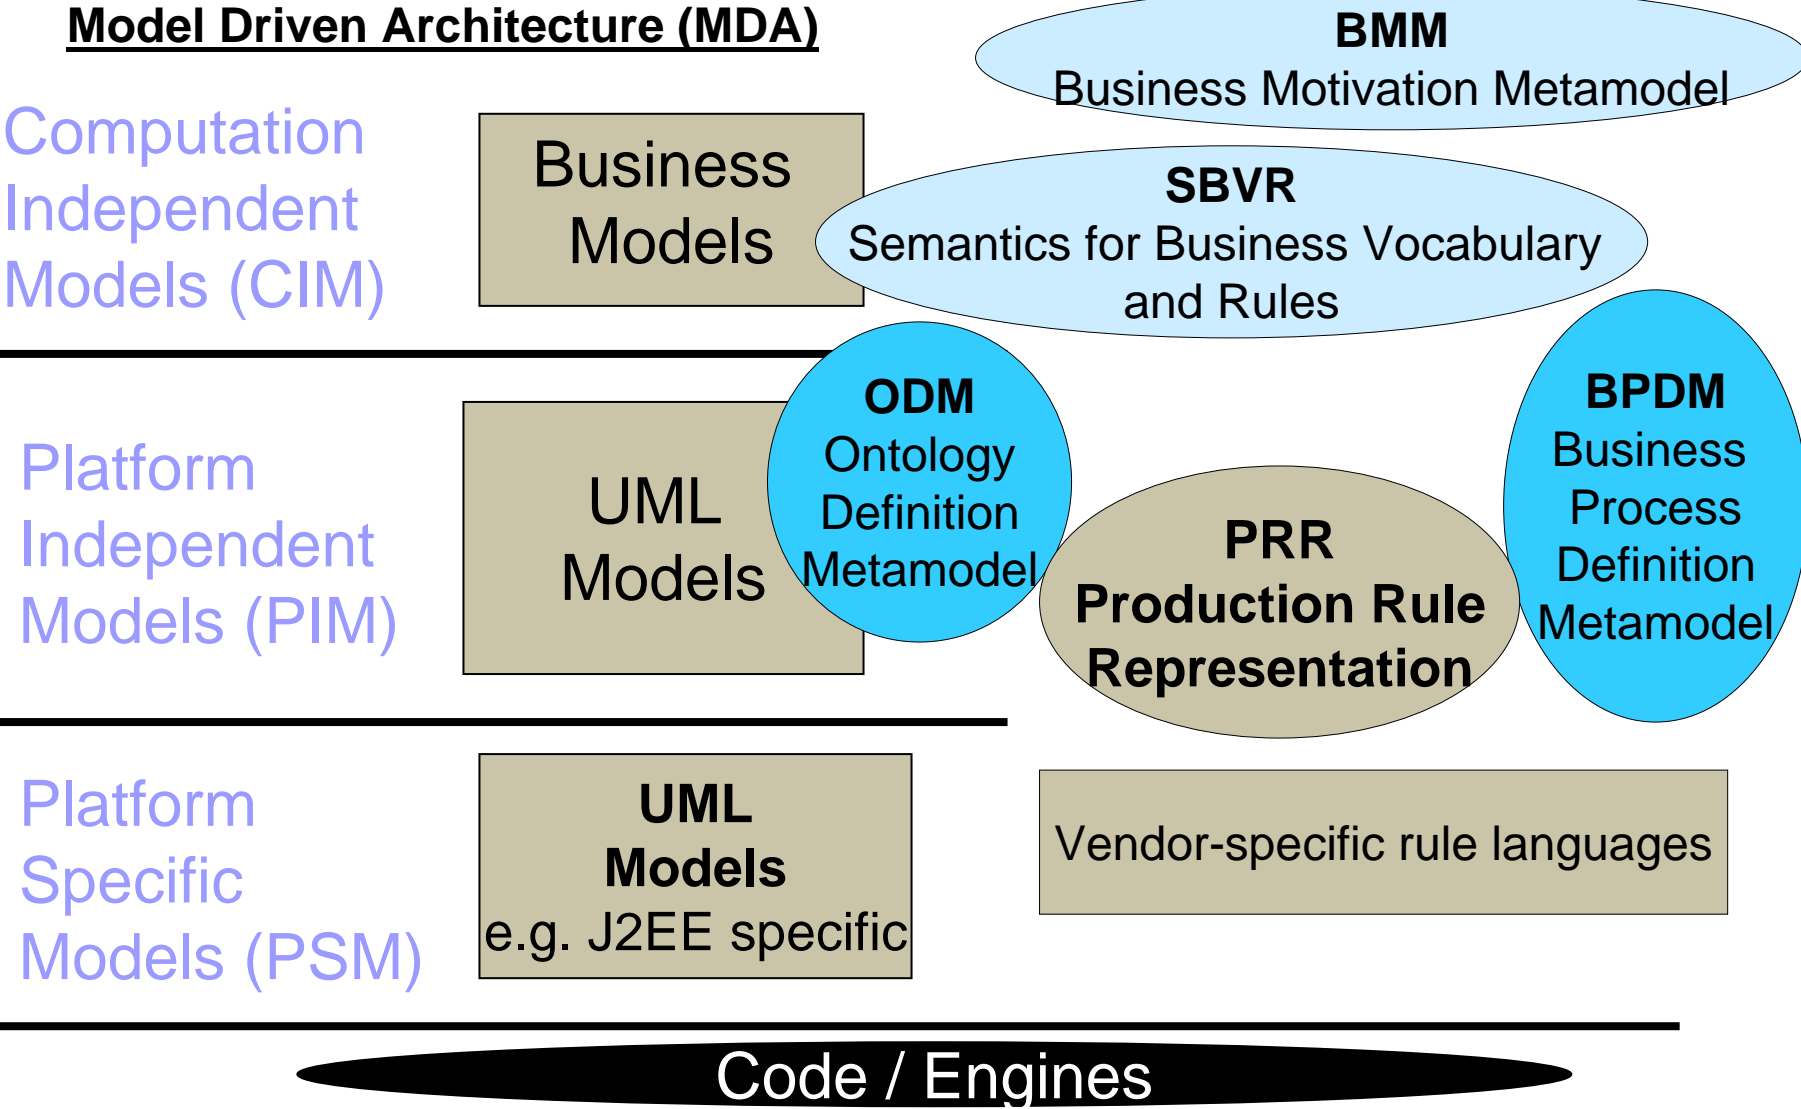

**Metamodel**  
eg domain classes

**UML2**

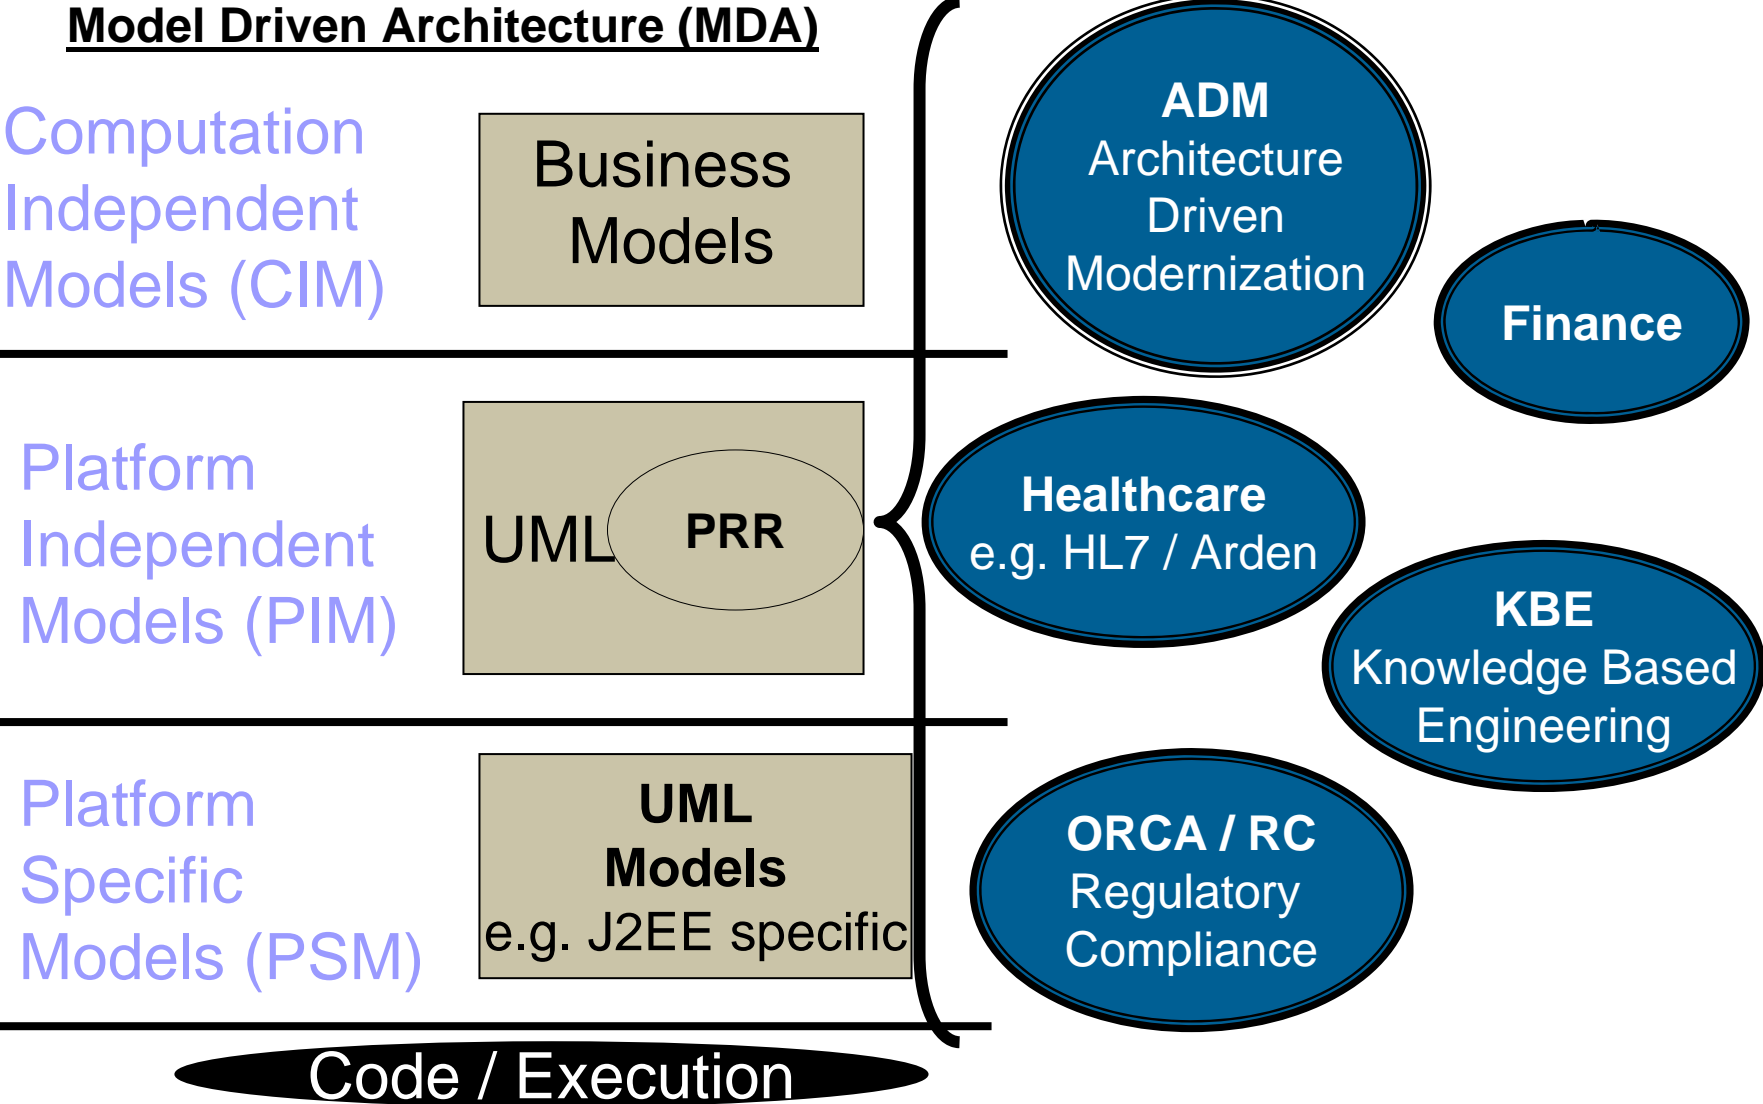

**Customer models**

**Code / Execution**

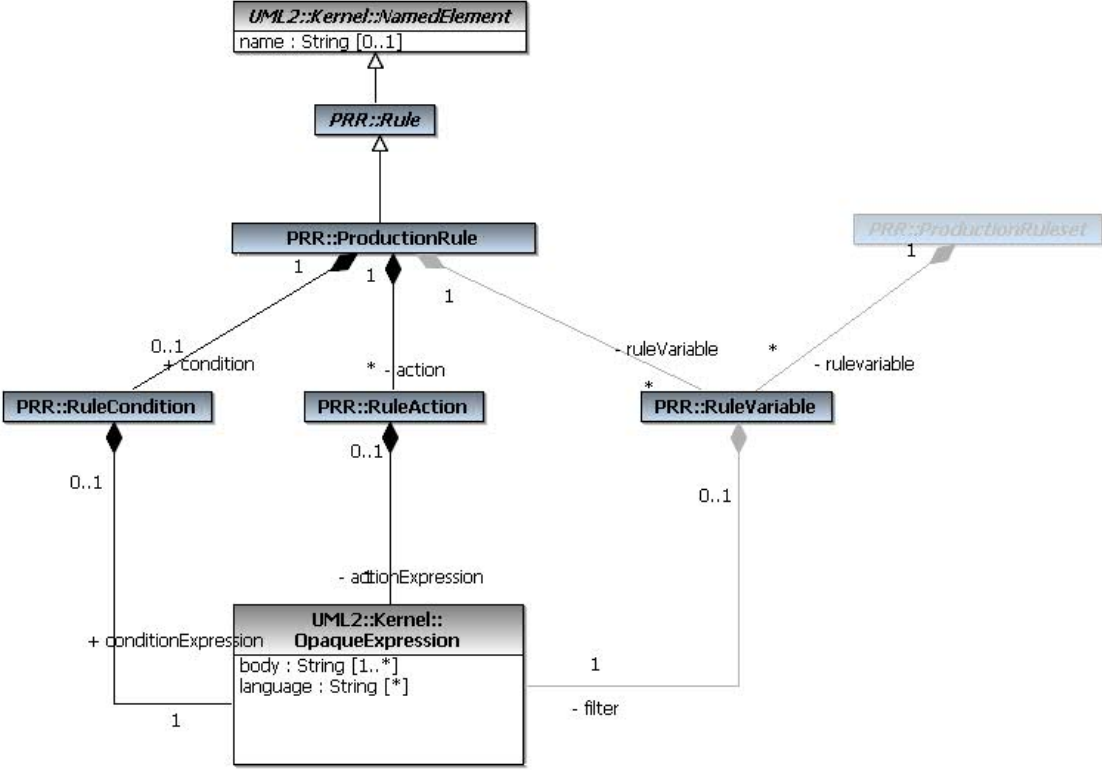

# OMG MDA and PRR

# OMG MDA: other domains that relate to PRR

# Simplified Rule Model

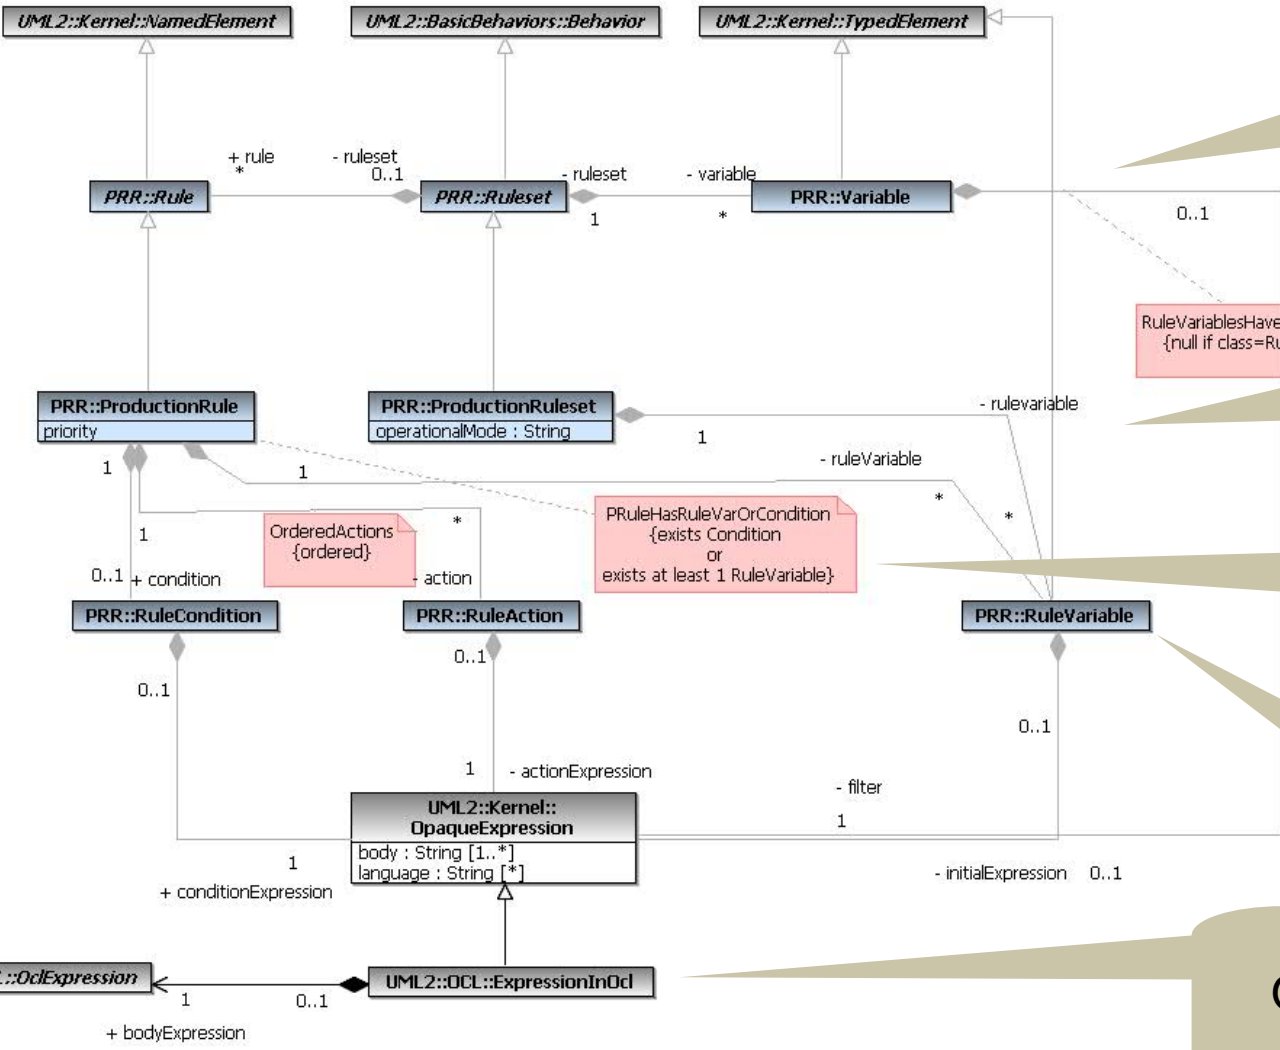

<b>PRR Core</b>	<b>PRR OCL</b>
Generic metamodel	OMG-specific subclass
Expression language a plug-in	OCL2 customized (includes actions)
General production rule model	Per RFP requirements

## Production Rule definition

- ▶ In Rete world, a rule is MORE than conditions + actions: introducing the `RuleVariable` (called a `pattern` in Blaze Advisor, a `variable` in JRules...)
  - ▶ Matches to a range of objects in scope / in a collection + an optional filter
  - ▶ Defined per rule (JRules) or per ruleset (Blaze Advisor)...
  - ▶ Effect:
    - ▶ Rule is effectively duplicated at runtime for each tuple
    - ▶ Note the `RuleVariables` can be changed by rule firings!
    - ▶ Cf pattern matching in PROLOG
  - ▶ Allows for powerful rule statements

# Production Rule metamodel overview

Generic rules, rulesets and variables

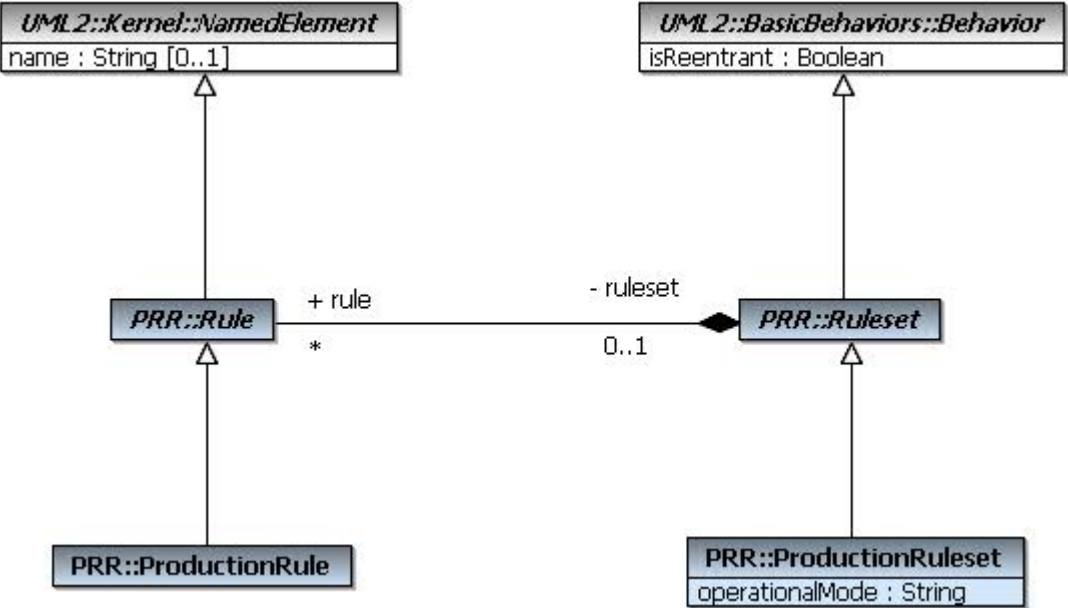

Production rules, rulesets

Rule Condition, Action (lists)

RuleVariables to create Rete bindings

(PRR OCL):  
OCL = expression language

# Ruleset and Rule metamodel

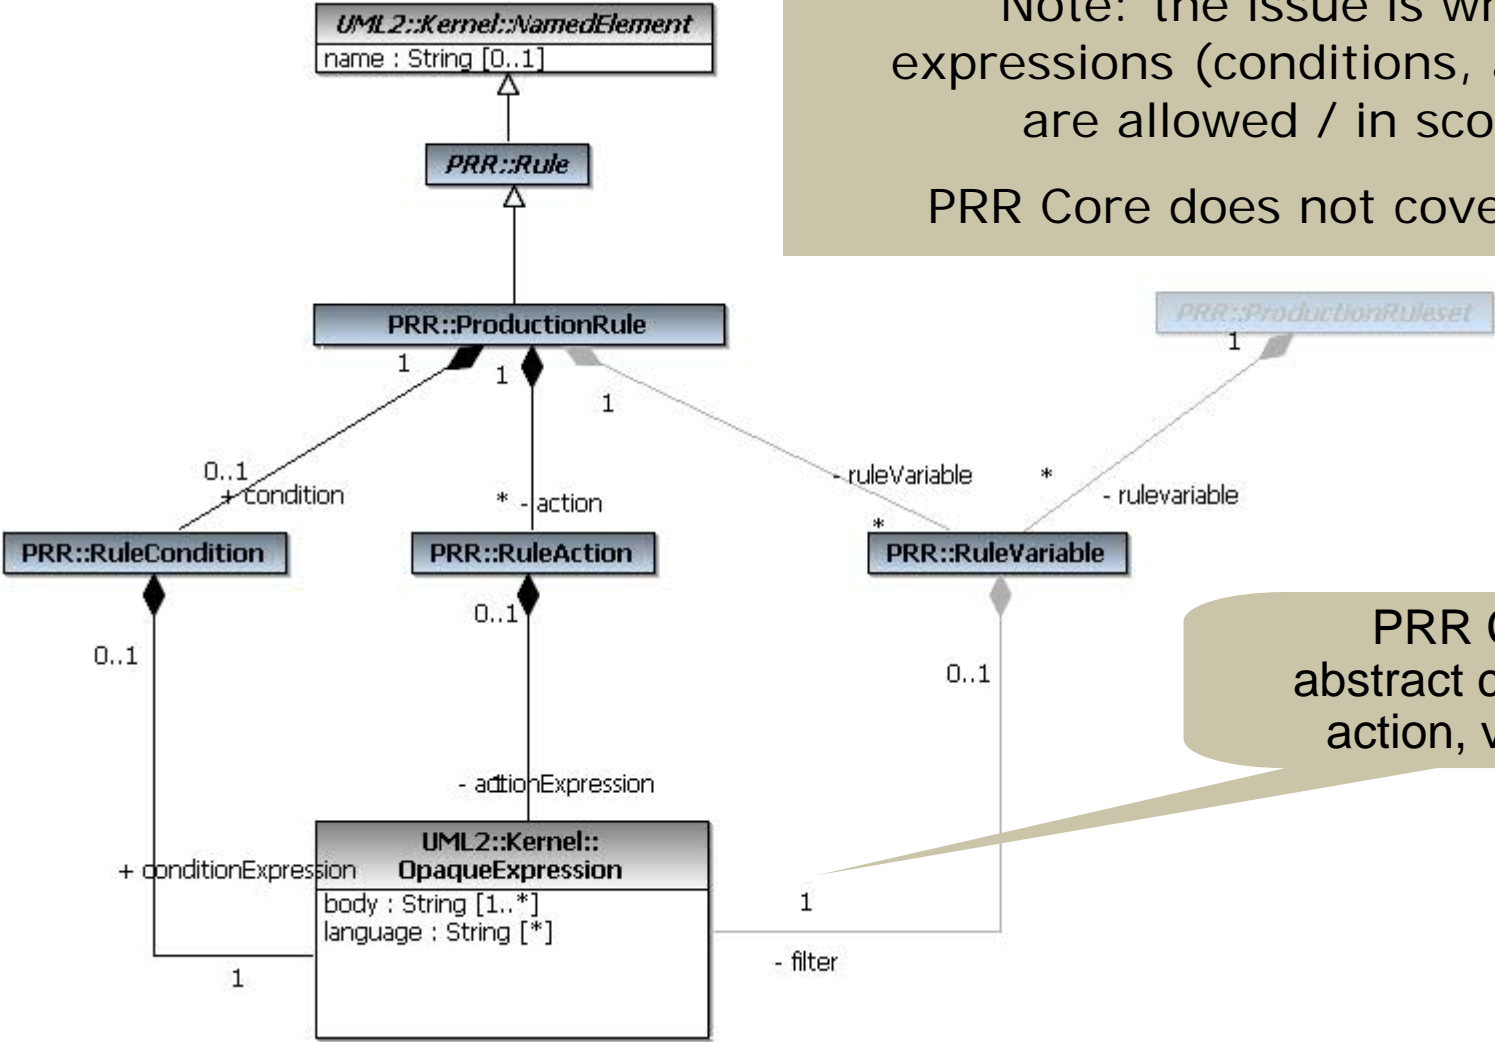

Generic rules, rulesets

Specialization for production rules

Note: clearly the generic model would benefit from being truly generic, with PR just as one subtype of rules

# Production Rule Metamodel

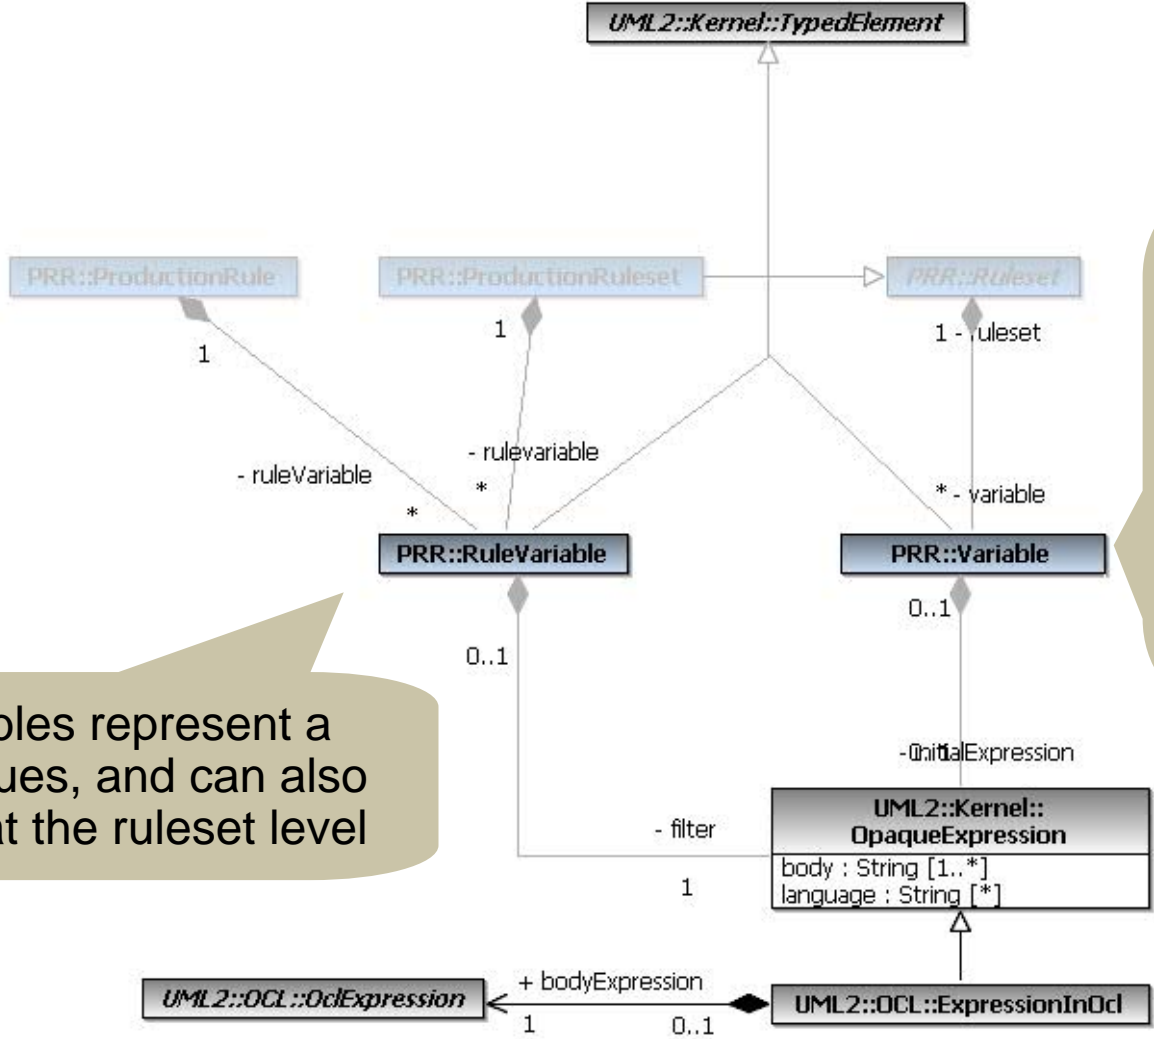

Note: the issue is what expressions (conditions, actions) are allowed / in scope  
PRR Core does not cover this.

PRR Core:  
abstract condition,  
action, variable

# Variable and RuleVariable metamodel

RuleVariables represent a range of values, and can also be defined at the ruleset level

Variables represent a single value used in rule evaluation, although this could be a collection

## Comparison with other Rule Standards

### ▶ RuleML

- ▶ Contributors to PRR (in RIF: Gerd Wagner, Said Tabet)
- ▶ PRRRuleML (Said Tabet)  
in development as a RuleML implementation of PRR Core

### ▶ OMG SBVR

- ▶ MDA CIM standard for documenting business rules  
with no IT context / assumed
- ▶ In “finalisation”

## Differences: RIF vs PRR

- ▶ NOTE: OMG PRR is for modeling, RIF is for interchange
  - ▶ Differentiator: interchange can be runtime
- ▶ PRR focused on 1 rule type based on existing use
  - ▶ Generic model defined for extensibility
- ▶ Data source: defined as model layer by UML (eg UML classes/types)
  - ▶ UML can map to MDA PSM level with different data sources eg Java, XML, etc
- ▶ PRR Semantics
  - ▶ Metamodel (with default XML specification)
  - ▶ Semantic description: textual

## RIF Issues vs PRR

- ▶ No surprises
  - ▶ PRR takes
    - ▶ Least common denominator approach for simplicity
    - ▶ Superset where easily mapped (eg RuleVariables as a ruleset or rule construct, for modeling)
    - ▶ Rule actions can invoke external methods for other services etc
- ▶ Coverage
  - ▶ Limited to 2 main types of rules (Rete inferencing + sequential)
    - ▶ No mixing allowed
  - ▶ Driven my **current** market pragmatics
- ▶ Extensibility
  - ▶ Roadmap for unsupported features post v1 – to be based on market requirements / demand
  - ▶ Extensibility will be covered by standards body (no metafacility)

## RIF Issues vs PRR (ctd)

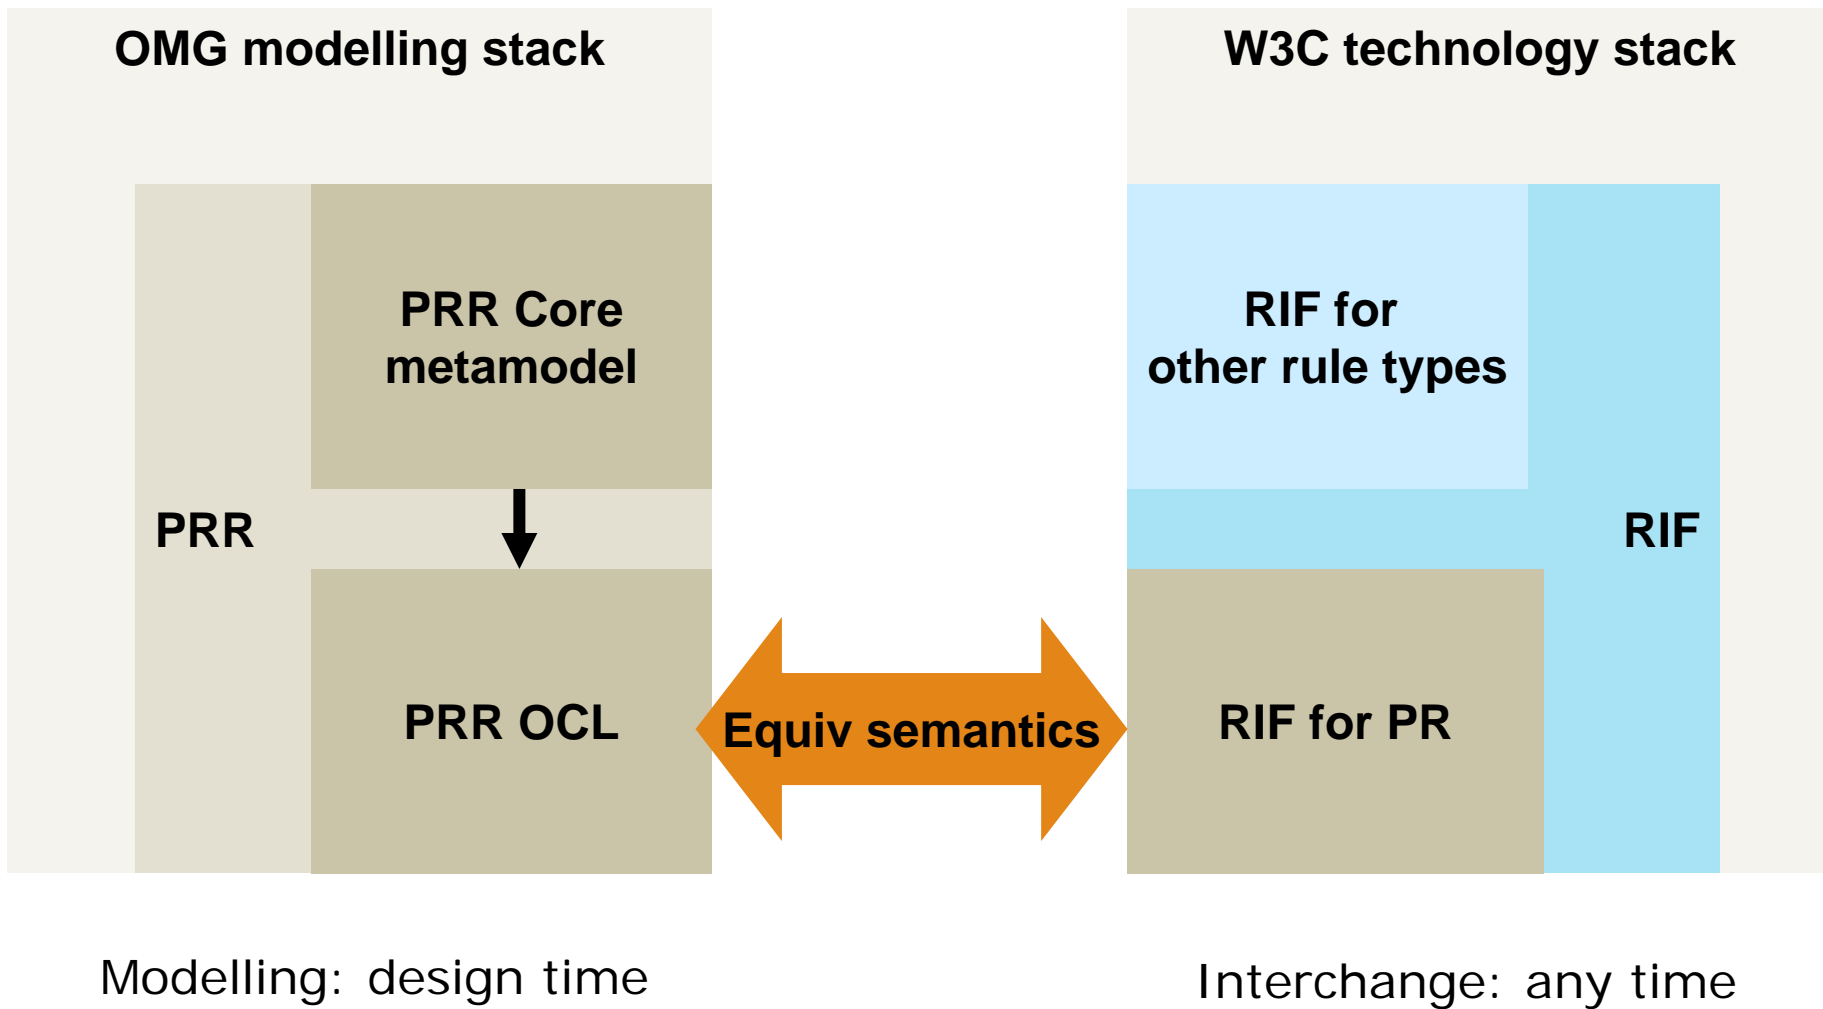

- ▶ Semantic Web support and/or is PRR a candidate Semantic Web Rule Language?
  - ▶ PR defined against OWL or RDF?
  - ▶ Qus:
    - ▶ What rule types make sense for a Semantic Web?
    - ▶ Is Semantic Web behaviour-free?
      - PRs usually used to represent behavior
    - ▶ Is Semantic Web for business internal use or B2B?
      - Most PR use cases are for these
  - ▶ Note: few business requests for Sem Web PR support at this time (but could be a chicken-egg situation)
- ▶ Low implementation cost
  - ▶ NOT a PRR issue; simplification principle helps here

## RIF Issues vs PRR (ctd)

---

- ▶ Support for W3C Specifications
  - ▶ PRR is at the MDA PIM level; technology platforms are PSM
    - ▶ XPath or RDF could be an expression language for conditions
  - ▶ Many PR vendors support XML / write rules against XSD

# W3C RIF: potential PRR use

## Summary

---

- ▶ PRR provides a standard metamodel for production rules as used in popular rule engines for business automation
- ▶ PRR is much simpler than RIF through scope limitations
- ▶ Expected to be completed / go to “finalization” later this year

Thank you
