Doing
both
scrolla

Data 2

document
windows
and pagina-

tion introduces new complexities to the styling

Data 4

(and pagination) of
XML content. Because
pagination introduces

arbitrary boundaries (pages
or regions on pages) on the
content, concepts such as the

Data 5

control of spacing at page,
region, and block boundaries
become extremely important.

Data 5

There are also concepts related ed to adjusting the spaces between lines (to adjust the

page vertically) and between words and letters (to justify the lines of text). These do

Data 5

not always arise with simple
scrollable document
windows, such as those

Data 5

found in today's browsers.
However, there is a corre-
spondence between a page

with multiple regions, such as a body, header, footer, and left and right sidebars, and a

Data 5

Web presentation using "frames". The distribution of content into the regions is

basically the same in both cases, and XSL handles both cases in an analogous

fashion.
